

"There's a statistical theory that if you gave a million monkeys typewriters and set them to work, they'd eventually come up with the complete works of Shakespeare. Thanks to the Web, we now know this isn't true." Ian Hart

Web Technology

Lecture 4: Introduction to HTML

The university web server

- In your H:\ drives, you can create a special folder called public_html.
- This is then web accessible at <http://homepages.abdn.ac.uk/yourname/pages/<filename>>
 - If <filename> is not specified, index.htm or index.php is shown, if present
- You need to run the publish script once the files are in place to make them visible.
- Details in practicals

Filenames

- On most production web servers, file names are **case sensitive**
 - e.g. index.htm, INDEX.HTM, Index.HTM, and INDEX.htm are all different files
- URLs are (almost) universally lower case (e.g. <http://bbc.co.uk/news>)
- For your sanity, **keep your filenames lower case.**
- Generally, **don't** use capital letters when writing markup or code unless you have a GENUINE reason to do so.

Filenames (2)

- URLs cannot contain spaces
- Filenames with spaces in them are translated to %20
 - E.g. if you put “my silly filename.htm” in your public_html folder, you’d need to go to <http://homepages.abdn.ac.uk/myname/pages/my%20silly%20filename.htm> to view it
- The lesson: don’t put spaces in filenames containing markup or source-code
- **But still name your files something vaguely sensible**

Those on home computers

- You can run a local webserver on your computer to host pages (on your machine only)
 - Windows: Use XAMPP
 - Mac: Use MAMP
 - Linux: I assume you know how to do that
- Put your pages in the htdocs or www folder
- These are then accessible at `http://localhost/<filename>`
- More details on MyAberdeen soon.

Have you used HTML before?

- ``
- `<center>`
- `<applet>`
- ``
- `<strike>`
- `<u>`

HTML

HTML Hypertext Markup Language

- HTML is not a programming language, it is a markup language
- A markup language is a set of markup tags
- HTML uses markup tags to describe web pages

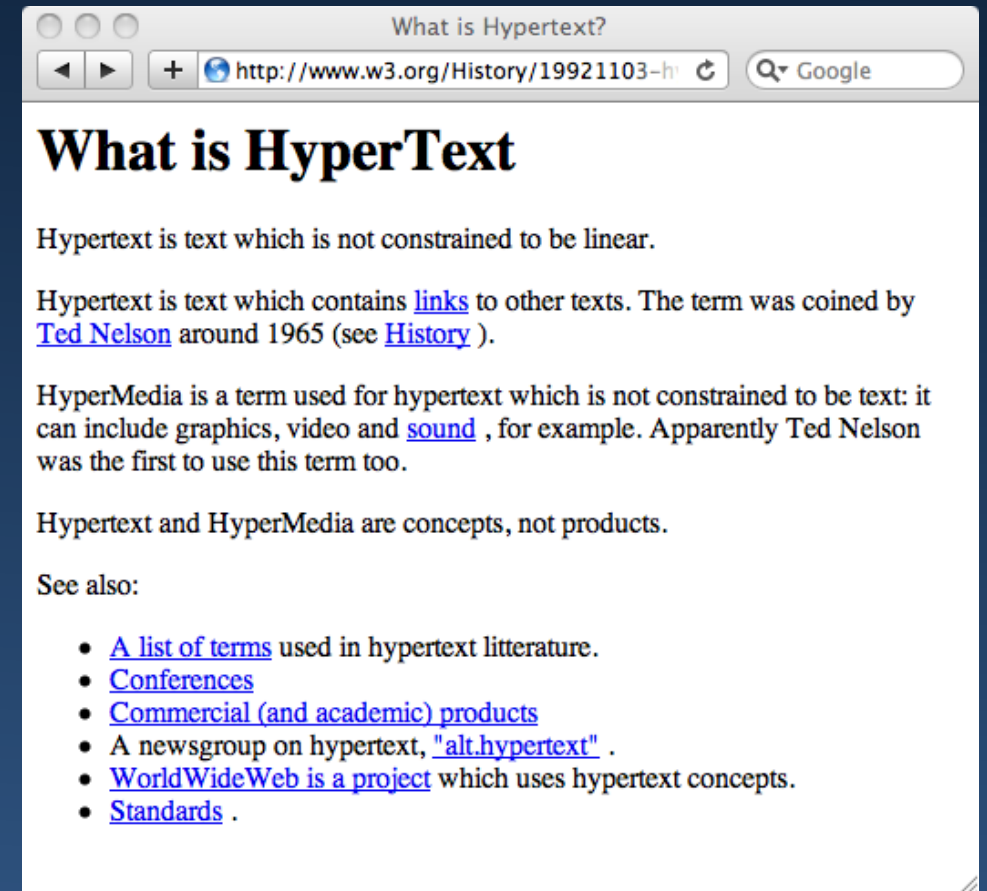

What HTML Looks Like

```
<h2 id="htmllooks">What HTML looks like</h2>
```

The oldest HTML on the Web

- "Last-Modified: Tue, 13 Nov 1990 15:17:00 GMT"
- Still functional in modern Web browsers
- <http://infomesh.net/html/history/early/>

The History of HTML

- Originally HTML was not a specification or standard.
- The IETF (Internet Engineering Task Force) published a draft proposal of HTML in 1993.
- In 1995, "HTML 2.0" was written, taking ideas from the original HTML draft.
- In 1997, the W3C published HTML 4.0 that adopted more browser-specific extensions.
- HTML 4.01 was published in 1999, with some errata noted in 2001.
- In 2000, the W3C also published the XHTML 1.0 specification, which was HTML re-structured to be a valid XML document.
- 2008 – 2014 HTML 5: From Working Draft to W3C Candidate Recommendation
- 2015 – HTML5 finalized, XHTML 2.0 largely abandoned.
- We will use HTML5

Structure of a HTML Document

```
<!DOCTYPE ...">
<html>
  <head>

    <title></title>
    ...
  </head>
  <body>
    ...
  </body>
</html>
```

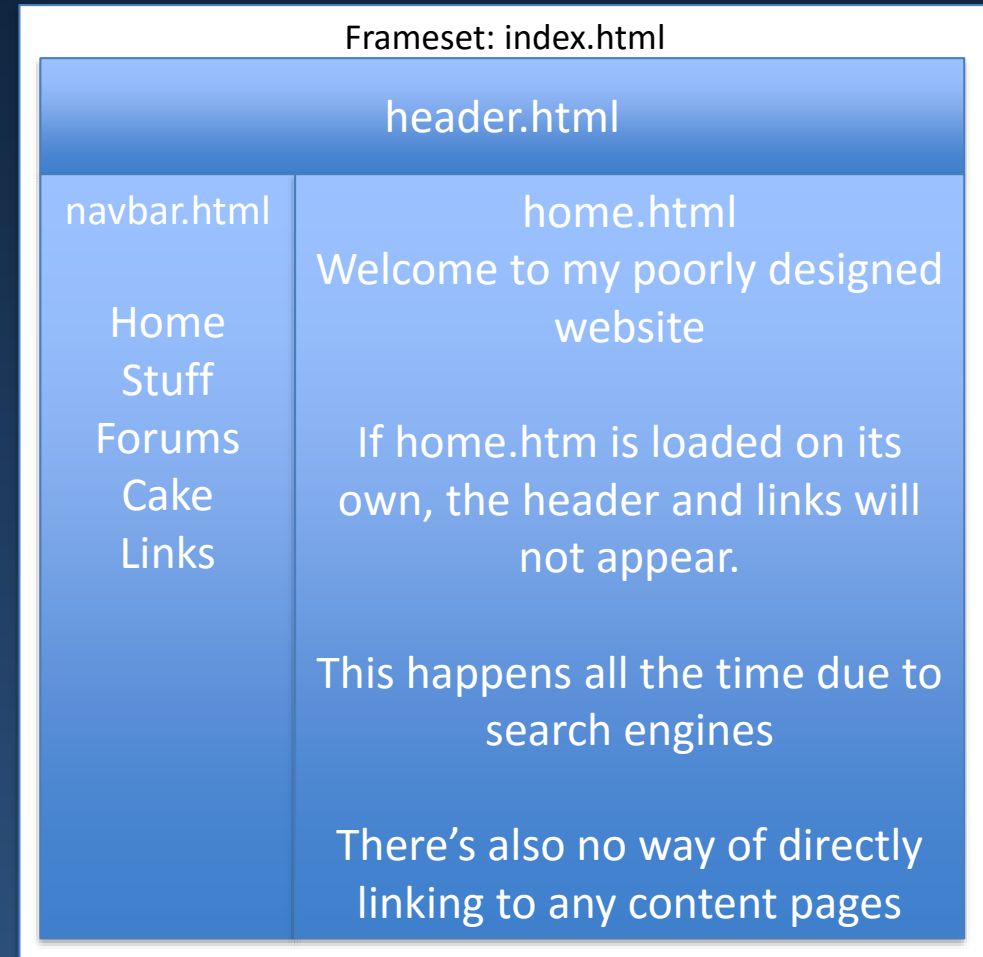

- Document type, so that browsers can determine how to interpret the document.
- The HTML Document
 - Head (document metadata)
 - Body (page content)

Document Type Definitions (doctype)

- Specifies the (X)HTML standards that the document conforms to.
- Used to be long winded things, with variants for the standards of the time (strict, transitional, frameset **[evil]**).
- `<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">`
- Thankfully, for HTML 5:
`<!doctype html>`
Does the trick. Sanity wins.

Frames

- Frames are **evil**
- Frames are not supported in HTML5, for good reasons
- iframes are still allowed
 - Use sparingly, if at all

First HTML

```
<!doctype html>

<html lang="en">
  <head>
    <meta charset="utf-8">
    <title></title>
  </head>

  <body>
  </body>
</html>
```

Title Tag

```
<!doctype html>

<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First
    Page</title>
  </head>
  <body>
  </body>
</html>
```

What can we use in the body of the document?

- Heading: `<h1> </h1> ... <h6> </h6>`
- Paragraph: `<p> </p>`
- Line Break: `
`
- Lists: ` ... `
` ... `
- Links: ` `
- Images: ``
- Emphasis: ` `
- Quoting: `<blockquote cite=""></blockquote>`

Heading Tag

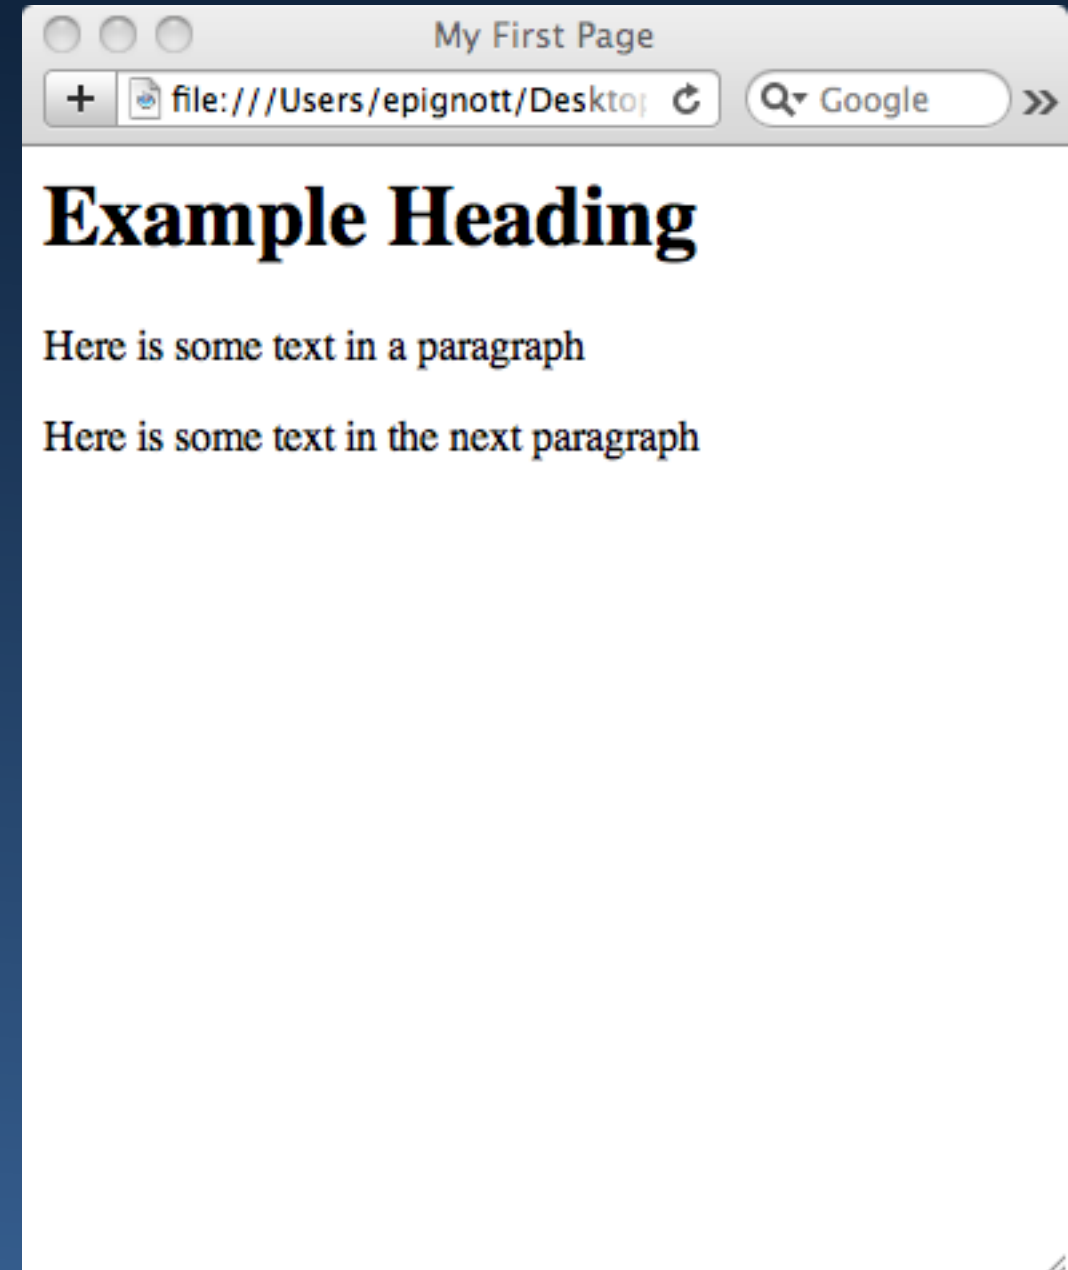

```
<!doctype html>

<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First
Page</title>
  </head>
  <body>
    <h1>Example
Heading</h1>
  </body>
</html>
```

Paragraph Tag

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First
    Page</title>
  </head>
  <body>
    <h1>Example Heading</h1>
    <p>
      Here is some text in a
      paragraph
    </p>
    <p>Here is some text in
    the next paragraph</p>
  </body>
</html>
```

Paragraph Tag

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>
  <body>
    <h1>Example Heading</h1>
    <p>
      Here is some text in a
      paragraph
    </p>
    <p>Here is some text in the
    next paragraph. Adding more
    text.</p>
  </body>
</html>
```

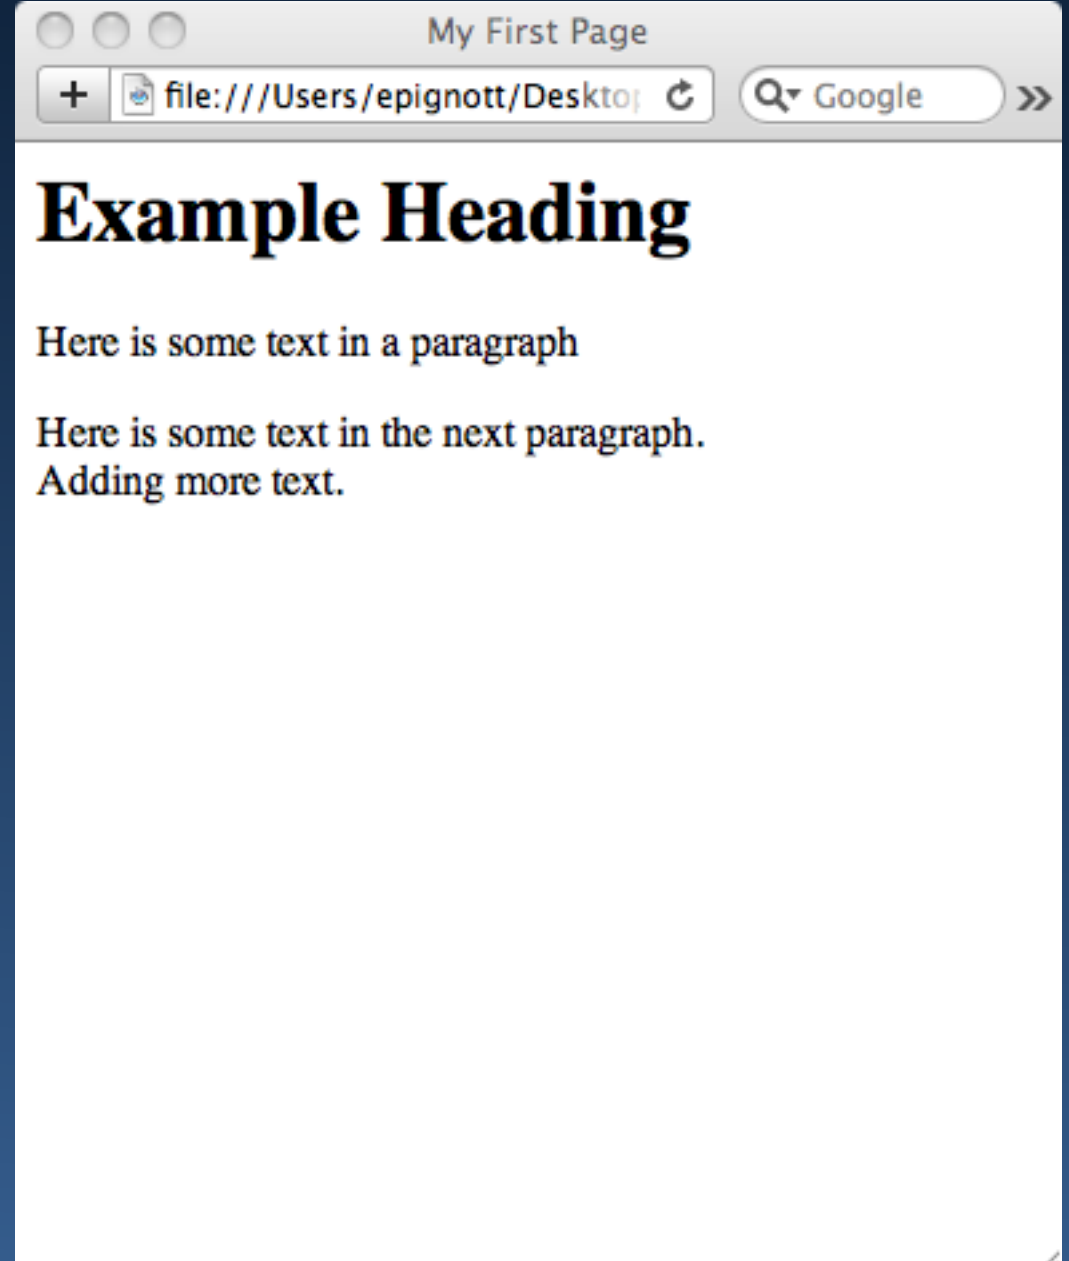

Example Heading

Here is some text in a paragraph

Here is some text in the next paragraph. Adding more text.

Line Break

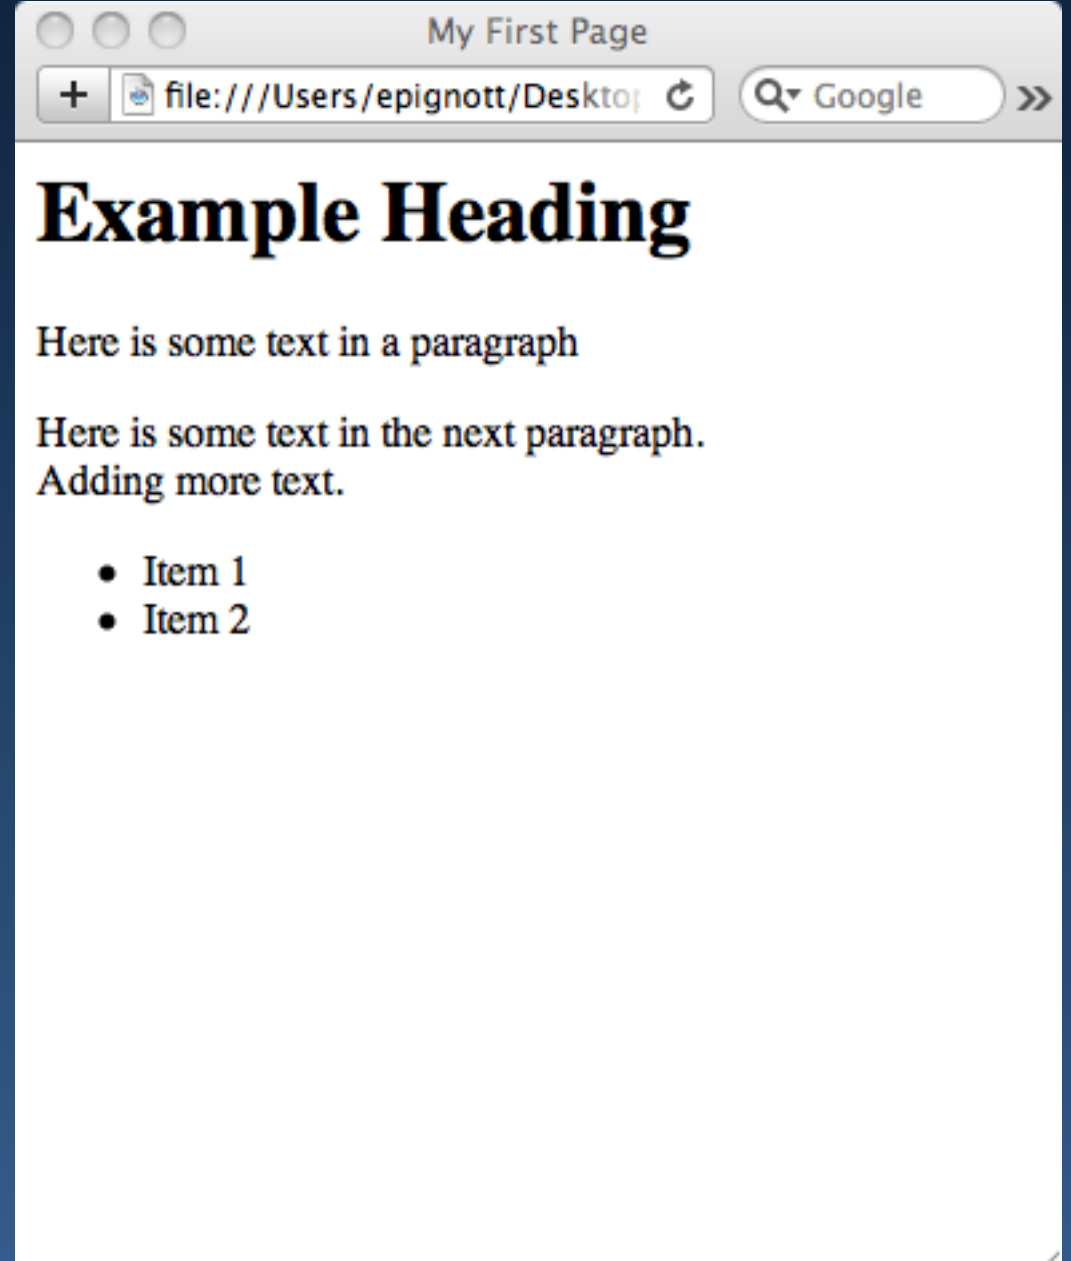

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First
Page</title>
  </head>
  <body>
    <h1>Example Heading</h1>
    <p>
      Here is some text in a
paragraph
    </p>
    <p>Here is some text in
the next paragraph. <br>
Adding more text.</p>
  </body>
</html>
```

Lists

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>
  <body>
    <h1>Example Heading</h1>
    <p>Here is some text in a paragraph</p>
    <p>Here is some text in the next
    paragraph. <br /> Adding more text.</p>

    <ul>
      <li>Item 1 </li>
      <li>Item 2</li>
    </ul>
  </body>
</html>
```

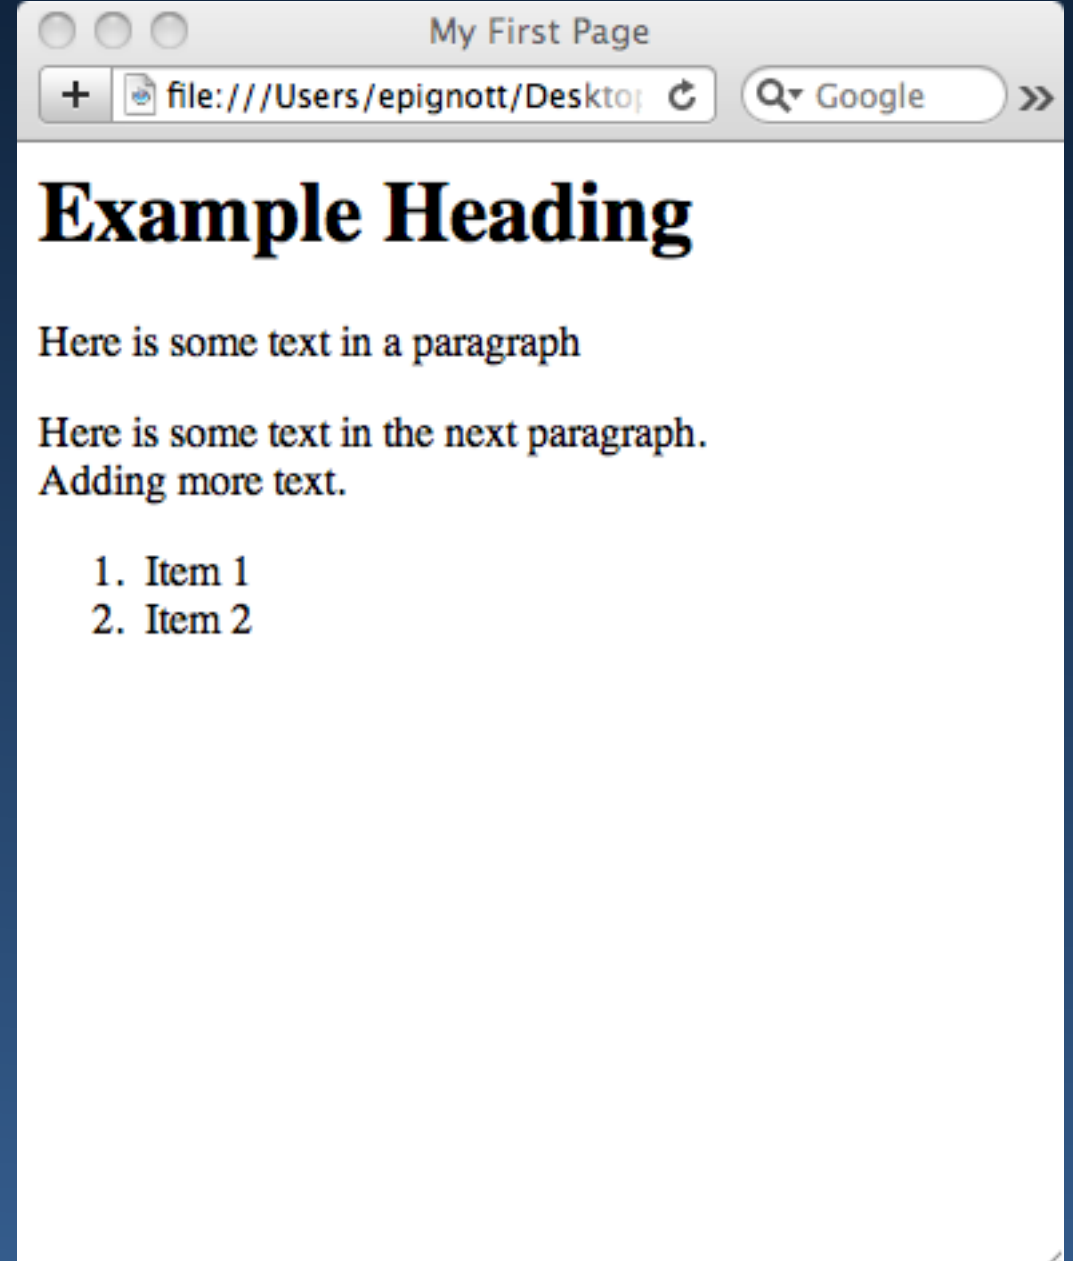

Ordered Lists

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>
  <body>
    <h1>Example Heading</h1>
    <p>Here is some text in a paragraph</p>
    <p>Here is some text in the next
    paragraph. <br /> Adding more text.</p>

    <ol>

      <li>Item 1 </li>
      <li>Item 2</li>
    </ol>

  </body>
</html>
```

Links

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>

  <body>

    <h1>Example Heading</h1>
    <p>Here is some text in a paragraph</p>
    <p>Here is some text in the next paragraph. <br /> Adding
more text.</p>
    <ol>
      <li>Item 1 </li>
      <li>Item 2</li>
    </ol>

    <p> A link to the

      <a
href="http://www.google.com">
Google </a> page </p>

  </body>
</html>
```

Images

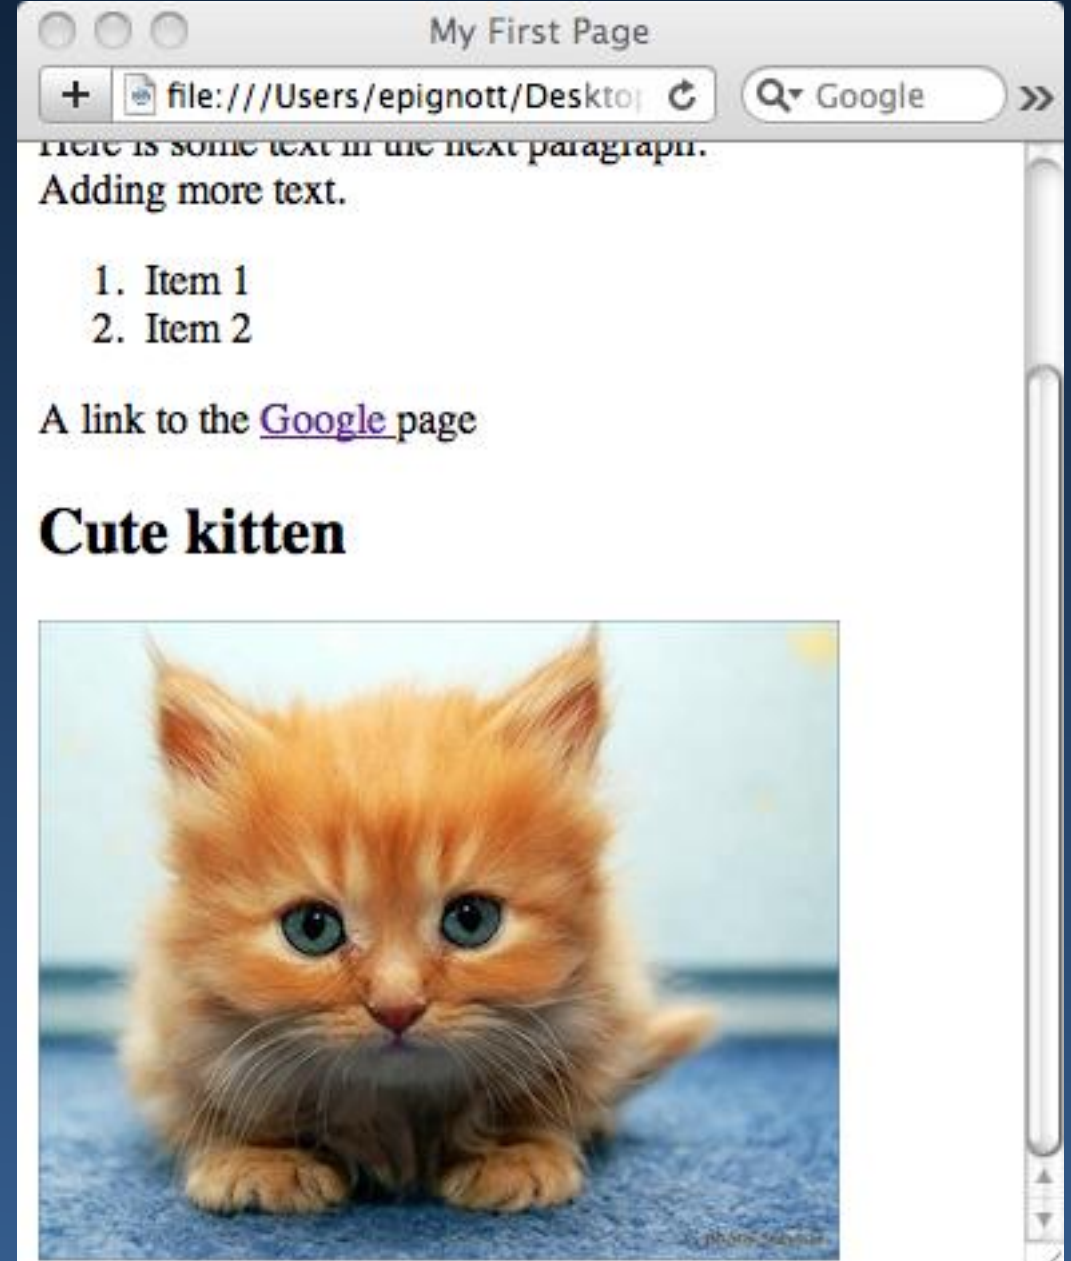

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>

  <body>
    <h1>Example Heading</h1>
    <p>Here is some text in a paragraph</p>
    <p>Here is some text in the next paragraph. <br /> Adding more
    text.</p>
    <ol>
      <li>Item 1 </li>
      <li>Item 2</li>
    </ol>
    <p> A link to the
    <a href="http://www.google.com"> Google <a> page </p>

    <h2> Cute kitten
    </h2>

  </body>
</html>
```

Emphasis

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>
<body>
  <h1>Example Heading</h1>
  <p>Here is some text in a paragraph</p>
  <p>Here is some text in the next paragraph. <br /> Adding more text.</p>

  Some text can be
  <em>emphasized</em>.
  <br />

  You can also give a
  <strong>stronger
  emphasis.</strong>

  <ol>
    <li>Item 1 </li>
    <li>Item 2</li>
  </ol>

  <p> A link to the
  <a href="http://www.google.com"> Google <a> page </p>
<h2> Cute kitten </h2>

</body>
</html>
```

Quoting other sources

```
<!doctype html>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>My First Page</title>
  </head>
```

<body>

```
  <h1>Example Heading</h1>
  <p>Here is some text in a paragraph</p>
  <p>Here is some text in the next paragraph. <br /> Adding more text.</p>
  Some text can be <em>emphasized</em>. <br />
  You can also give a <strong>stronger emphasis.</strong>
```

Here comes a quotation:

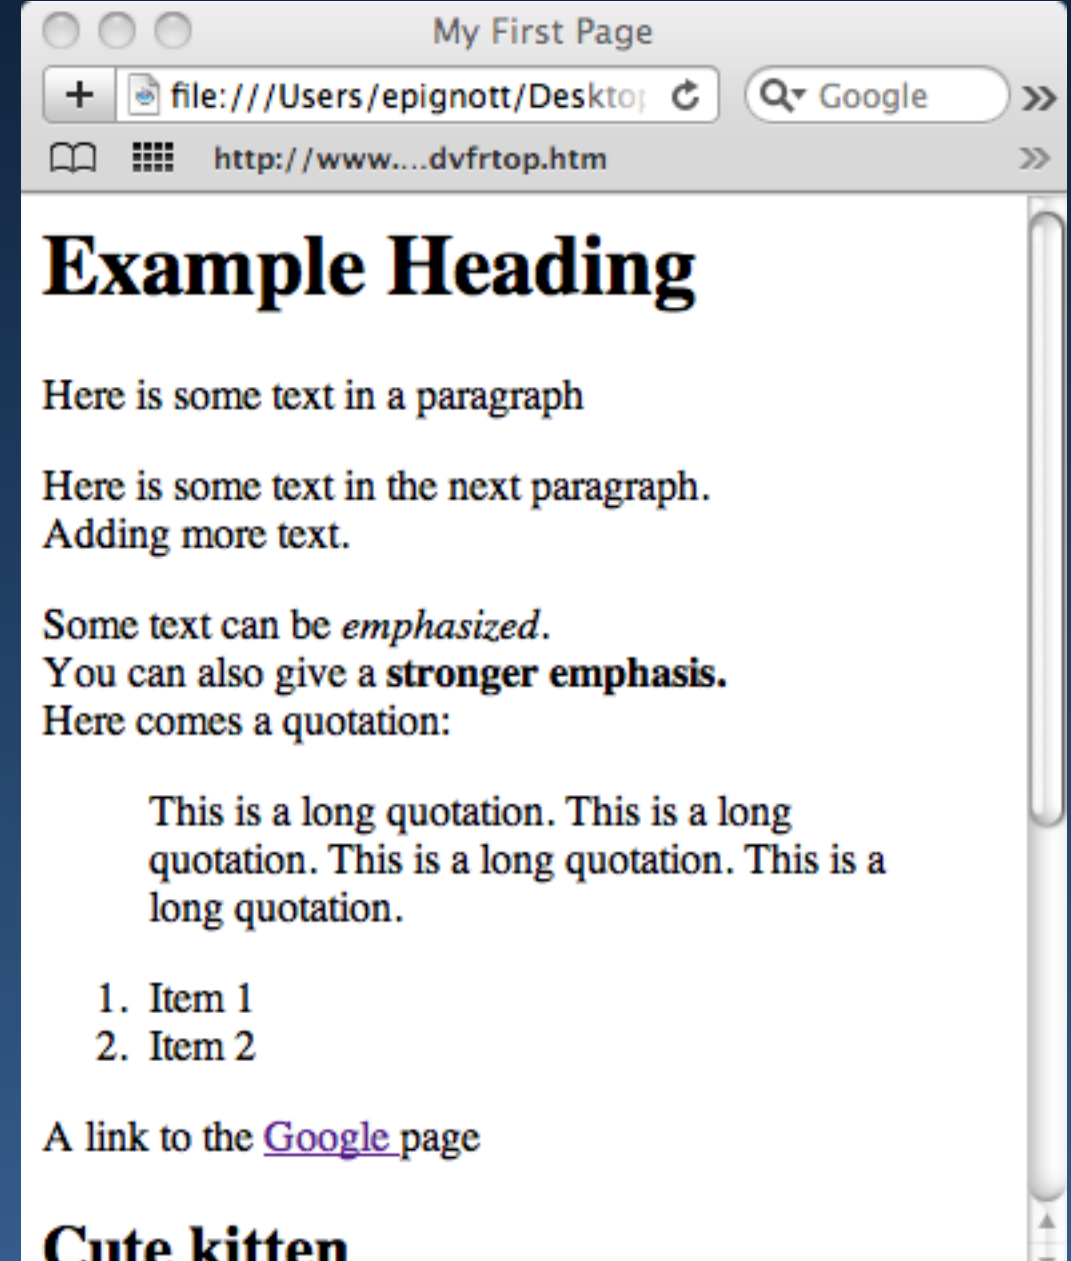

```
<blockquote>This is a
long quotation. This is
a long quotation. This
is a long quotation.
This is a long
quotation.</blockquote>
```

```
<ol>
  <li>Item 1 </li>
  <li>Item 2</li>
</ol>
<p> A link to the
<a href="http://www.google.com"> Google <a> page </p>
<h2> Cute kitten </h2>

```

</body>

</html>

To learn more about HTML

<http://w3schools.com/html>

What is the correct HTML for creating a hyperlink?

A: `UoA`

B: `UoA`

C: `UoA`

D: `<a>http://www.abdn.ac.uk`

HTML5

- Provides many new features over HTML 4 and XHTML 1.x
- Key features are better multimedia support and better form fields for the modern web
- Together with CSS 3 and JavaScript, can make complex, functional web applications
- Makes development for mobiles and other non-pc devices much easier!

Deceased, or the corpse is twitching:

Which other applications are next to die?

Bad HTML

- Many pages on the internet contain "bad" HTML
- When HTML is invalid, web browsers approximate the intended layout
 - But the **results are** unpredictable!
- You should write valid HTML and follow good coding standards

```
<html>
<head>
<title>This is bad
HTML</title>
<body>
<font face="comic sans ms">
<h1>You cannot use Comic Sans
MS and be taken seriously in
life
</body>
```

HTML5 vs XHTML 1.x

- HTML5 is less strict than its predecessor, XHTML 1.x
- Less rigid rules
 - Surprisingly, `<html><body>` and even `<head>` can be omitted
- However, “normal” coding standards should be adhered to, even if it is not an absolute rule
- Older versions of IE may crash without the “standard” tags above, despite it being valid to omit them.

HTML5 good practice (1/3)

- All HTML5 documents must have the DOCTYPE declaration.
 - Though the case doesn't matter, `<!doctype html>` or `<!DOCTYPE html>`
- The html, head, title, and body elements should be present.
- HTML Elements should Be Properly Nested
 - `Some text here`
- Elements should be closed
 - `<p>This is a paragraph`
`<p>This is another paragraph (BAD)`
 - `<p>This is a paragraph</p>`
`<p>This is another paragraph</p> (GOOD)`

HTML5 good practice (2/3)

- Empty elements (e.g. `
` and ``) do not need to be closed, but **be consistent**:

- `
`
``

Or:

- `
`
``

- **HTML Elements Should be in Lower Case**

- `<P>This is a paragraph</P>` (**BAD**)

- `<P>This is a paragraph</p>` (**WORSE**)

- `<p>This is a paragraph</p>` (**GOOD**)

HTML5 good practice (3/3)

- HTML5 Documents should contain the Root Element

```
<html lang="en">  
  <head> ... </head>  <body> ... </body>  
</html>
```

- Attribute Names Should use Lower Case

- `` (BAD)

- `` (GOOD)

- Attribute Values Must be Quoted

- `` (BAD or WRONG)

- `` (CORRECT)

Accessibility

HTML5 has better support for screen readers:

```
<body>  
  <header>  
    <nav><!-- links --></nav>  
  </header>  
  <main><!-- actual page contents --></main>  
  <footer><!-- footer information --></footer>  
</body>
```

Use them!

Markup Validator Service

<http://validator.w3.org/>

Summary

In this lecture

- Introduction to HTML
- How to write a basic page
- HTML5 good practice

What next?

- Example of interesting Web pages
- More advanced HTML5
